

MULTI-MODAL COMMUNICATION USING A SESSION SPECIFIC PROXY SERVER

Abstract Of The Disclosure

5 A method and apparatus for multi-modal communication includes
a controller (236) operably coupled to at least one multi-modal session
proxy server (226). On a per multi-modal session basis, the controller
(236) provides the multi-modal session proxy server (226) with a multi-
10 modal proxy identifier (138). The multi-modal proxy identifier (138) is
then provided to at least one browser with a per session multi-modal
proxy evaluator (220) having a browser proxy identifier (140) wherein the
browser proxy identifier (140) is evaluated in view of the multi-modal
proxy identifier (138). The multi-modal session proxy server (226) then
15 receives an information request (231) from the browser with per session
multi-modal proxy evaluator (220) wherein the requested information is
fetched from a content server (240). When the requested information is
retrieved, a multi-modal synchronization coordinator (122) notifies the
other browser with per session multi-modal proxy evaluator (232), via a
20 multi-modal synchronization interface (234).
